Very good electronic book and valuable one. It is actually written in basic words instead of difficult to understand. I discovered this ebook from my i and dad encouraged this publication to discover.

Brand New Book ***** Print on Demand *****.Excerpt from Proceedings of the Academy of Natural Sciences of Philadelphia, 1870 Their lateral borders are much more obtuse, and they terminate in a broad, thick, notched point. The ends bordering the notch are most thickened and porous, apparently indicating the attachment of a long moveable snout. The nasals do not rise from the forehead in the vaulted manner so conspicuous in Sivatherium and Rhinoceros, but, as previously indicated, simply continue the curvature of the forehead. One of the most remarkable characters of the fossil is the greater extent backward of the lateral nasal notch than in Sivatherium. In this it ceases far forward of the position of the horn cores, situated above the orbits. In the Colorado fossil the notch continues back and beneath the position of the horn cores, where the nasals apparently become continuous with the maxillaries. The relative position of the orbits cannot be ascertained, as all the contiguous parts are broken away. They appear to have been situated behind the position of the horn cores. It is probable that the fossil may pertain to the same animal as the remains from the Manvaises Terres of Nebraska, described under the name of Titanotherium, but in the state of extreme uncertainty as to its collocation, it may with equal probability be referred to other genera, perhaps to Megalomeryx, or it may have been an American species of the Sivatherium. Under the circumstances it may be referred to a new genus, with the name of Megacerops Coloradensis. Prof. O. C. Marsh, of Yale College, exhibited a number of vertebrae of a new Dinosaurian from the cretaceous green sand near Barnsboro , N. J. He observed...
